# ECONOMIC IMPORTANCE OF BANANA IN INDONESIA

- Banana contribute 35% in production of tropical fruits in Indonesia
- Grow every where, mostly small holders, few banana industries
- Desert and cooking bananas with many varieties

## BANANA PRODUCTION IN INDONESIA 1995-2009

Source: Indonesian Statistic Center Agency

# Banana Germ Plasma in Yogyakarta

**More than 300  
accessions  
of banana  
collection**

# Nursery of Banana Industry

**In vitro propagation**

# Backyard Banana Production

# Field Production of Banana Industry

# Banana Production

# Banana Market

# Production Constrains

- Scatter small holders and not intensive cultivation make it difficult for wide area production management
- Low quality of fruits
- **Diseases spread**

# Major Diseases

- Banana Blood Disease (Blood Disease Bacterium / BDB)
- Fusarium Wilt (*Fusarium oxysporum* fsp *cubens* / Foc)
- Bunchy Top Virus (Banana Bunchy Top Virus / BBTV)
- Leaf spots (Sigatoka etc)

# Banana Export Volume

**Source : United Nations Commodity Trade Statistic Database**

# Disease Intensity of Banana Wilts in South Bengkulu District

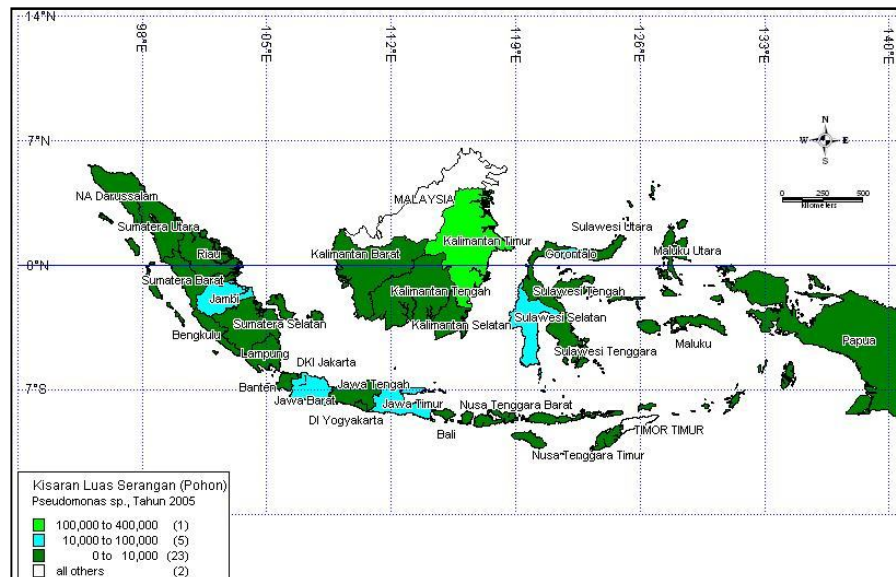

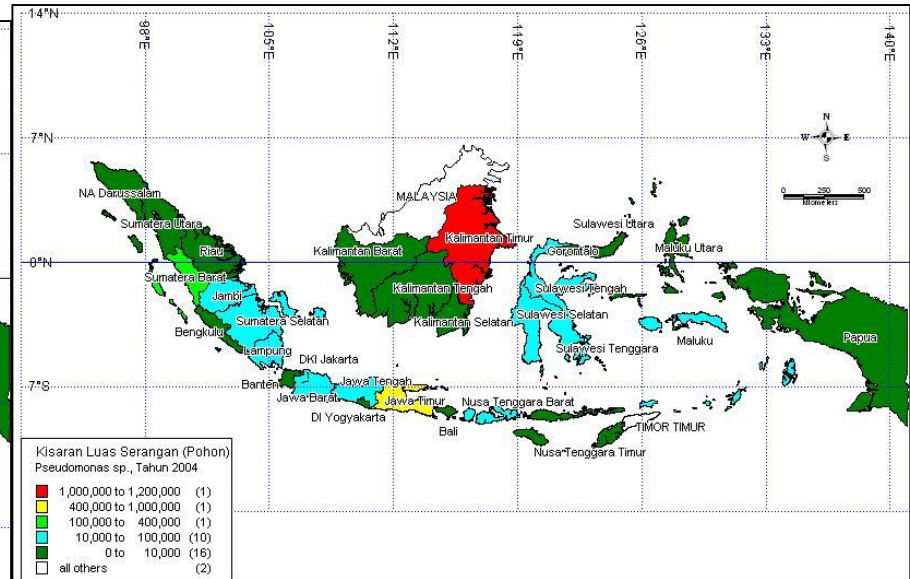

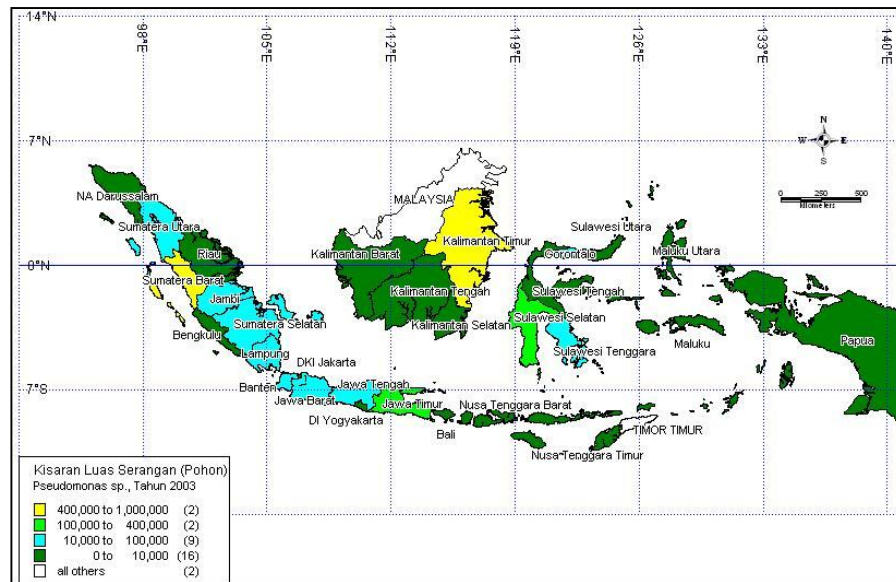

No	Banana Cultivar	Disease Intensity (%)
1	Kepok /Saba	46.86
2	Ambon / Gros Mitchel	71.67
3	<b>Jantan</b>	1.49
4	Tanduk / Plantain	5.56
5	Rawas	0
6	<b>Muli</b>	0
7	Kapar	0

# Map of BDB Distribution in Indonesia

## 2003 - 2005

# Banana Wilts – Blood Disease

Cavendish at NTF banana industry in Lampung

# Banana Blood Disease in East Kalimantan

# Observation of banana wilts in the field

# Blood Disease

# Blood Disease

# Blood Disease Bacterium

- Firstly described in 1920s found in Celebes (Sulawesi island) as *Pseudomonas celebensis*
- As the member of *Ralstonia solanacearum* species complex in Phylotype IV (Moko pathogen in Phylotype II)
- Slow growing on agar medium with the  $\varnothing$  2-3 mm in 5 days on CPG medium
- Not infectious on Solanaceous plants
- Survive with mild symptom on *Heliconia spp.* and *Canna spp.*

# **Blood Disease Bacterium** continue

- **Soil borne but the population declines sharply in few months**
- **Insect transmitted (by pollinators, decay visiting insects, banana pests)**
- **In the field cooking banana (kepok, saba, pisang awak etc) were found with highly incidence of BDB infection compared to dessert banana**

# BDB Diagnostic PCR

**The primer  
sequences  
are in press**

Ooze

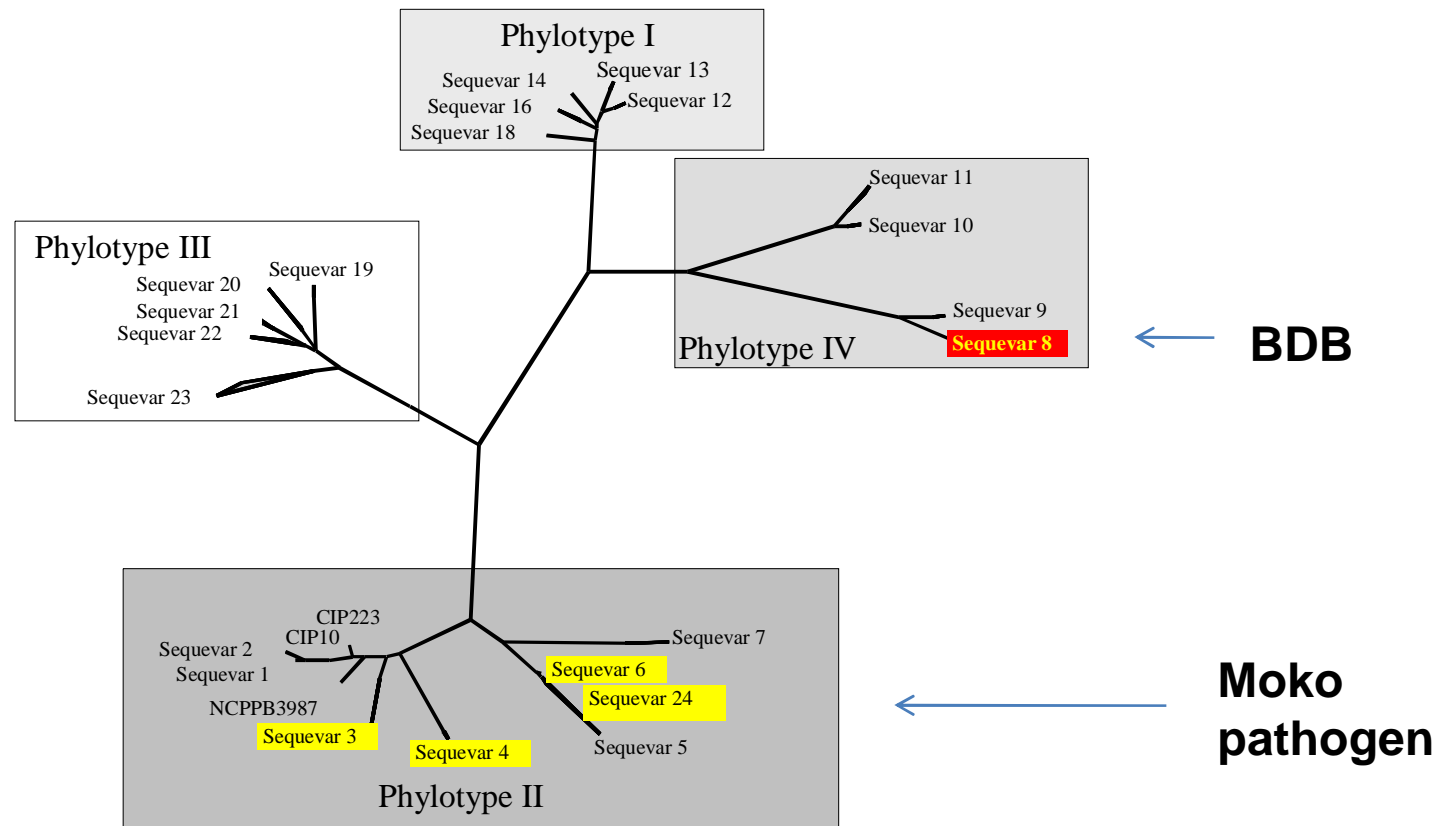

# BDB (Phylotype IV) vs Moko pathogen (Phylotype II)

Species	<i>Ralstonia solanacearum</i> Species Complex												
Phylotype	Phylotype I			Phylotype II			Phylotype III			Phylotype IV			
Distribution	Asia, Africa, South America			America (race 2 – worldwide)			Africa			Indonesia, Japan, Australia			
Biovars	3	4	5	2T	1	2	2T	1		2T	1	2	P. sy BDB
Division	Division 1			Division 2			?			?			
Multi-locus Genotypes	8	9		15	21	19	29	30	1	2	24	26	
	10	12	11	16	22		31	32	3	4	25		
	13	14		17	23	20	33		5	6	28	27	
Races	1	4	5						2	3		1?	1?

The phenotypic based schemes (biovars and races) and genotypic based schemes (RFLP analysis and phylotyping). (After Gillings and Fahy (1994))

# BDB vs Moko Pathogen continue

Phylogenetic tree generated from partial endoglucanase gene sequence data showing the phylogenetic relationships of sequevars and phylotypes (Fegan et al in press)

# Blood Disease Bacterium

Slow growing on CPG/TZC,  
Ø 2-3 mm in days

PCR identification and detection

Survive with mild symptom on  
*Heliconia* spp and *Canna* spp

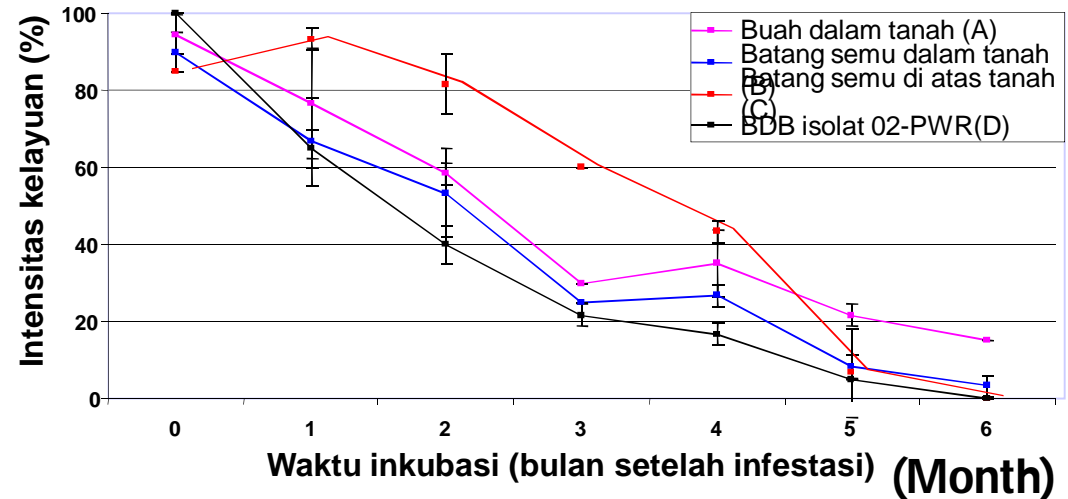

Only infectious on banana,  
not infectious on *Solanaceous*  
plants

# Survival of BDB in the Soil

## BDB Pure Culture in the soil

## BDB in the Infected Tissue

# Fusarium Wilt, *Fusarium oxysporum* fsp. *cubense* (Foc)

# Comparison of BDB vs Foc diseases

	<b>Fusarium Wilt</b>	<b>Blood Disease</b>
<b>Organism</b>	<b>FOC (Fungus)</b>	<b>BDB (Bacterium)</b>
<b>Ooze from infected tissue</b>	<b>NO</b>	<b>YES</b>
<b>Found in Fruit</b>	<b>NO</b>	<b>YES</b>
<b>Point of Entry into Plant</b>	<b>From soil</b>	<b>Male flower (bracts, via insects), injury, and soil</b>
<b>Spread in Plant</b>	<b>Root→inner cortex of butt→Pseudostem</b>	<b>Bract→True stem→Fruit pulp→→Butt→Stem of Sukcer</b>
<b>Resides in Soil</b>	<b>Yes</b>	<b>Yes, shorterterm</b>
<b>Resides in Plant Material</b>	<b>Yes</b>	<b>Yes, short term</b>

	<b>Fusarium Wilt</b>	<b>Blood Disease</b>
<b>Resistance to</b>	<b>Exists (No externally visible indicator)</b>	<b>NON , only escape</b>
<b>Leaf Symptoms (Unbunched)</b>	<b>Yellow leaves, start at the bottom and work up leaving dead leaves at bottom, affected leaves retain normal shape</b>	Top Leaves Green, mid leaves yellow, Bottom leaves green, affected leaves bow downwards
<b>Leaf Symptoms (Bunched)</b>	"unbunched" Same as	<b>Last leaf emerged is yellow</b>
<b>Matt Survival</b>	<b>Mother plant dies, suckers survive (Sucker dies in very susceptible varieties)</b>	<b>Mother plant dies and suckers may survive</b>
<b>Internal symptoms - Fruit</b>	<b>NO</b>	<b>YES</b>
<b>Internal symptoms - True Stem</b>	<b>NO (only occur under extreme conditions)</b>	<b>YES (?mother to daughter spread, ?soil spread)</b>
<b>Internal symptoms - Pseudostem</b>	<b>Leaf sheathes, long unbroken red-brown streaks</b>	<b>NIL or YES accationally</b>
<b>Speed of Symptom development</b>	<b>Slower</b>	<b>Faster</b>
<b>Odour from sever symptoms</b>	<b>"Fusarium" smell (TR4)</b>	<b>NIL (not to be confused with "Erwinia" smell of soft rot)</b>
<b>Most common infection site</b>	<b>Root</b>	<b>Male Flower Bract</b>

# Tropical race 4 - FOC PCR

Extract DNA

PCR

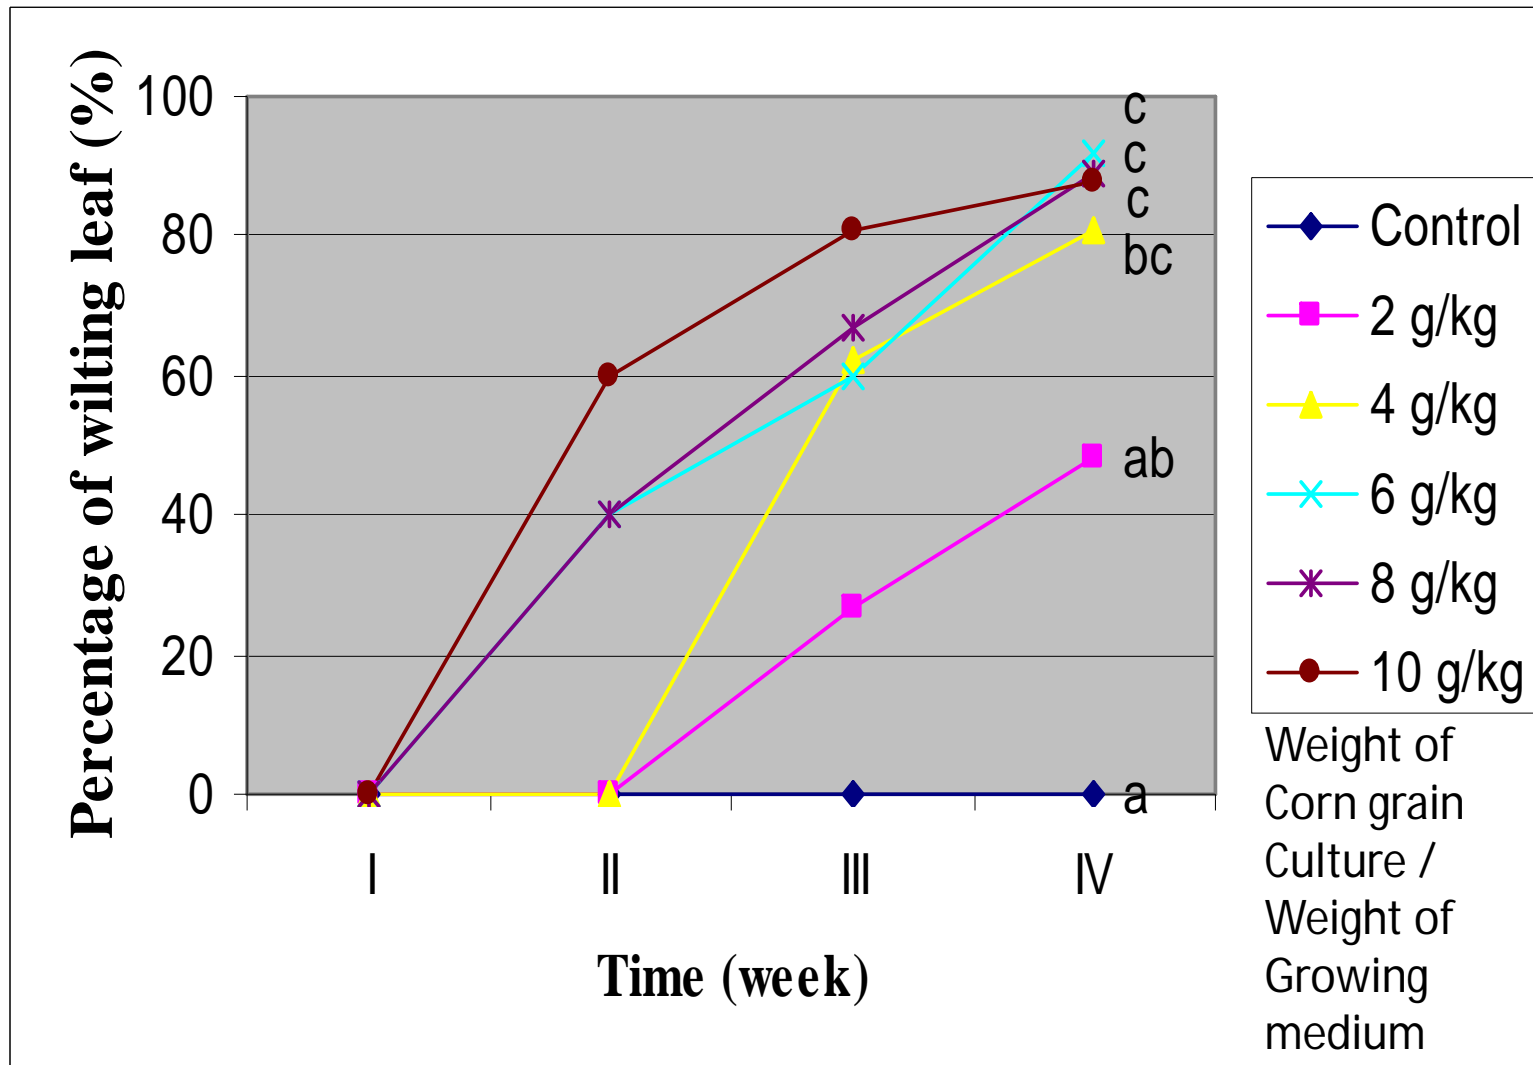

# Foc TR4 PCR identification

**The primer sequences are in press**

Inoculation of Foc at different population density, the higher the concentration the higher the disease severity and the shorter the incubation period

# **Incidence of Foc samples found in Sumatera, Bangka, Java, and Kalimantan**

<b>No</b>	<b>Type of Banana</b>	<b>%</b>
<b>1</b>	<b>Pisang Ambon (Gros Mitchel)</b>	<b>44</b>
<b>2</b>	<b>Pisang raja</b>	<b>15</b>
<b>3</b>	<b>Pisang Kepok</b>	<b>15</b>
<b>4</b>	<b>Pisang Awak</b>	<b>20</b>
<b>5</b>	<b>Cavendish</b>	<b>5</b>

- **Field trial showed that Barangan was highly susceptible towards TR4 of Foc infection dying in the first year after field planting , whereas cultivar Kepok Kuning, Puju and Panjang were more resistant and survive until the fifth year but declining**
- **Resistance mechanism of banana cultivar was correlated with peroxidase activity in the plant roots. The higher peroxidase activity, the more resistance the banana cultivar towards TR4 of Foc infection**

# MANAGEMENT OF BANANA WILT DISEASES

- Integrated control with wide area management is needed
- National Banana Wilt Task Force was established in Indonesia early 2000
- Eradication by herbicide or kerosene mat injection, burning or digging the infected mats/tissues
- Isolating the infected mats/lands

# MANAGEMENT OF BANANA WILT DISEASES continue

- Disease Free seedlings (from tissue culture) for replanting and never use suckers obtained from infected mats or endemic area
- Optional planting dessert banana in BDB endemic areas with flower/fruit bagging and male flower de-budding
- Avoid planting dessert banana in Foc endemic areas
- Planting cooking bananas in Foc endemic areas and plant rotation.

## MANAGEMENT OF BANANA WILT DISEASES continue

- De-budding male flowers after fruiting
- Bagging the fruits using insecticide plastic/paper bags
- Biological control using fluorescent pseudomonads, *Trichoderma*, *Gladiolus* etc with compost application, however the results may be not consistent
- Intensive cultivation with organic fertilizers (composts, humus etc)
- Disinfection of agricultural tools used in the field

# Flower de budding and fruit bagging to protect from visiting insects

# Banana Leaf spots

# Virus Diseases
